            NCI CGAP_Ctl is a normalized cDNA library containing the following tissue(s): Osteoarthritic Cartilage The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, dispeated with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the manner of the synthesis of first-strand cDNA contains a library tag mean and the followed the strand cDNA contains a library tag mean and the followed the synthesis of first-strand cDNA contains a library tag mean and the followed the synthesis of first-strand cDNA contains a library tag mean and the followed the synthesis of the synthesi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EST 05-FEB-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

NCI_CGAP_FT2 is a subtracted constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The library was subtracted according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. The tissue was provided by Dr. TAG_TISSUE-Human Lung Aveolar Macrophage

Consensus quality: 18638 bases at least Q30
Consensus quality: 188095 bases at least Q30
Consensus quality: 188095 bases at least Q30
Estimated insert size: 1700000; agarose-fp estimation
Estimated insert size: 1700000; agarose-fp estimation
Quality coverage: 7.63 in Q20 bases; sum-of-contigs estimation
* NOTE: This is a "working draft' sequence. It currently
* Consists of 22 contigs. The true order of the pieces
* snot known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N. but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Direct Submission

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                               Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by

and The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping project (Fric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center For additional information about the map position of this sequence, see thtp://www.nhgri.nih.gov/DIR/GTB/GHR7, send mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu

SOURCE INFORMATION: This clone was derived from human PAC library RPCI-4, prepared by Pieter de Jong and coworkers at http://www.chori.org.using the

Submitted (17-DEC-1998) Joint Genome Institute, Lawrence Livermore National Laboratory, 7000 East Ave., Livermore, CA 94551, USA Mational Laboratory, 7000 East Ave., Livermore, CA 94551, USA Mational Laboratory, 7000 East Ave., Livermore, CA 94551, USA MS and sequence are oriented from p telomere to centromere. Cosmid R29177 overlaps cosmid R29659 (AC003400) to the left from bases 1 to 7,688 of this accession and overlaps cosmid R20064 (AC003107) to the right from bases 33,879 to 45,858. Additional map and sequence information may be obtained at:

NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

GENERAL INFORMATION:

GENERAL INFORMATION:

TILE OF INVENTION: Cancer Gene Determination and Therapeutic Screening Usining Sign-
TILE OF INVENTION: Gene Sets

TILLE OF INVENTION: UNMBER: US/09/968,007A

CURRENT PILING DATE: 2000-10-02

PRIOR PAPLICATION NUMBER: US/60/237,173

PRIOR PILING DATE: 2000-10-02

PRIOR PELING DATE: 2000-10-02

PRIOR PELING DATE: 2000-10-02

PRIOR PILING DATE: 2000-10-02
APPLICANT: Augustus, Meena
APPLICANT: Buner, Reinhard
APPLICANT: Ebner, Reinhard
APPLICANT: Ebner, Reinhard
APPLICANT: Carter, Rennard

Consensus quality: 188095 bases at least Q30
Consensus quality: 188095 bases at least Q30
Estimated insert size: 193376; sum-of-contigs estimation
Quality coverage: 7.63 in Q20 bases; agarose-fp estimation

* NOTE: This is a 'working draft' sequence. It currently
consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
                   Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ACL15044 195476 bp DNA linear HTG 05-OCT-2002 Homo sapiens chromosome 16 clone CTD-2551B20, WORKING DRAFT SEQUENCE, 22 unordered pieces.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

* NOTE: This is a 'working draft' sequence. It currently

* Consists of 22 contigs. The true order of the pieces

* arbitrary. Gaps between the contigs are represented as

* runs of N. but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2 (bases 1 to 195476)

* NOTE: This is a 'working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* truns of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

* NOTE: This is a 'working draft' sequence. It currently
consists of 22 contigs. The true order of the pieces

* anbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

* NOTE: This is a "working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                             2 (bases 1 to 195476)

Consensus quality: 171229 bases at least 040
Consensus quality: 18638 bases at least 030
Consensus quality: 188095 bases at least 020
Estimated insert size: 170000; agarose-fp estimation
Estimated insert size: 170000; agarose-fp estimation
Quality coverage: 7.63 in 020 bases; sum-of-contigs estimation
Quality coverage: 7.73 in 020 bases; sum-of-contigs estimation
* NOTE: This is a 'working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      195476

Consensus quality: 182638 bases at least Q30
Consensus quality: 188058 bases at least Q30
Consensus quality: 188095 bases at least Q30
Consensus quality: 188095 bases at least Q30
Estimated insert size: 170000; agarose-fp estimation
Quality coverage: 7.63 in Q20 bases; agarose-fp estimation
Quality coverage: 6.7 in Q20 bases; sum-of-contigs estimation.
* NOTE: This is a 'working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* trus of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* truns of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                US-09-972-032-2

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

tamoxifen resistant, or to treat osteoporosis, by increasing levels of BRCoA3 in cells. The encoding polymucleotide can be used to inhibit translation of a mRNA encoding ERCoA3. BRCOA3 acts as a coregulator protein and can bind to the estrogen receptor to activate a molecular or cellular response in the cell. The present sequence represents the human

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cerivity of (II) as useful in gene therapy techniques to restore normal cerivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cappend to produce other types of data and products dependent on DNA and and control of sequences. AASGA197-AASG9564 represent novel human diagnostic
coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

 Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
 67
 The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a coding sequence of the

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent to be tested for antinosphastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent which is convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarinoma, carcinoma, clear cell cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's

 The invention relates to a novel polymucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polymucleotide of the invention may have a use in gene therapy. The polymucleotide and polymeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the suanosine triphosphate-binding protein coupled receptor. The protein sequences shown in ADCR7618-ADCR7623 represent polymucleotide sequences related to the invention.

17-NOV (HUMA-) HUMAN GENOME SCI INC WPI; 2001-541565/60. 

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.

Disclosure; SEQ ID NO 8137; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins CABB4678-ABB18001) useful for preventing, treating or ameliocating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease,

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of by protein or gene therapy. The genes are isolated from a range of mutibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and covarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

New polynucleotide, useful for preparing a composition for treating a

```
ö
 The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene thorapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The polynucleotide sequences shown in ADC85548-ADC87616 encode GPCR's of the
 The present invention relates to novel carcinoma associated (CA) nucleic acid sequences from both mouse and human. In particular the invention discloses a recombinant nucleic acid comprising a fully defined PR domain protein 11 (PRDM1 - a carcinoma-associated gene) nucleotide sequence. The sequences of the invention are useful for identifying compounds that modulate the activity of a carcinoma associated protein (CAP) which are potentially useful in treating carcinomas. Among the diseases and
 Novel recombinant carcinoma-associated gene, PRDM11 useful for diagnosing cancer, and for screening for agents for treating cancers and
patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Organ: Ul-CF-EM1"
/note="Organ: Lung; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I; Ul-CF-EM1 is a normalized CDMA library containing the following tissue(s): Primary Lung Cystic Fibrosis Epithelial Cells. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand CDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded CDNA was ligated to an EcoR I adaptor, disested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonuclactide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CTGCTCAGGT.

with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GTTAAGCGTC.

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. cDNA Library Preparation: M.B. Soares Lab Clone distribution: NCT-CGAP clone distribution information can be found through the I.M.A.G.E. Consortium/LLML at:

IMAGE:3086731 3', mRNA sequence.
synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an BCOR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CCATTAAGTG. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 AC135044 195476 bp DNA linear HTG 05-OCT-2002 Homo sapiens chromosome 16 clone CTD-2551B20, WORKING DRAFT SEQUENCE, 22 unordered pieces.
 Consensus quality: 171229 bases at least 040
Consensus quality: 182638 bases at least 030
Consensus quality: 188095 bases at least 030
Consensus quality: 188095 bases at least 030
Estimated insert size: 1700000; agarose-fp estimation
Estimated insert size: 193376; sum-of-contigs estimation
Quality coverage: 7.63 in 020 bases; sum-of-contigs estimation.
* NOTE: This is a "working draft" sequence. It currently
* consists of 22 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

```
NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repears; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

## MAPPING INFORMATION:

The Sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7, send mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu/gsc

### SOURCE INFORMATION:

This clone was derived from human PAC library RPCI-5, prepared by Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bacpac.med.buffalo.edu) using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from

one male donor.

The clone may be obtained either from Genome Systems, Inc. (http://www.genomesystems.com) or Research Genetics, Inc. (http://www.resgen.com); or from Pieter de Jong.

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the right is RP4-814D15. Actual start of
this clone is at base position 1 of RP5-1142J19; actual end is at
base position 96975 of RP5-1142J19.

A transposon was identified in the cloning vector for RPS-1142J19. Location/Qualifiers

 During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made too resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with thair source databases:

Em: FMED: Sw: SMISSROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at the WORMPEP database can be found at the work anger ac. uk/Projects/Celegans/wormpep This sequence chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at

RPI-20208 is from the library RPCI-1 constructed by the group of Pieter de Jong: For further details see http://www.chory.org/bacpac/home.htm
 This sequence is the entire insert of clone RPI-20208 The true left end of clone RPI-120G22 is at 135606 in this sequence. Location/Qualifiers

Dumquery@sanger.ac.uk Clone requests: colonerquest@sanger.ac.uk on Feb 5, 1998 this sequence version replaced gi:2578126.
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with corresponding to the overlapping clone, as we submit sequences with The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
 19592 TCCTGACCTCGTGATCCGCCCGCCTCAGCTTCCCCAAGTGCTGGGGATTACAGGCATGAGC 19651
 HBS/G9 linear PRI 05-JUN-2003 Human DNA sequence from clone CTA-57G9 on chromosome 22q12.1,
 Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;
Mammalia; Butheria; Primates; Catarrhini; Hominidae; Homo.

 FEATURES
 Direct Submission

Direct Submission

Submitted (27-UTL-2000) Sanger Centre, Hinxton, Cambridgeshire,
CBL0 1SA, UK. B-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk

On Jul 1, 2000 this sequence version replaced gi:8546617.

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone amen. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence has been finished according to sequencing problems,
such as compressions and repeats, but not necessarily within known
annotated human repeat sequence elements (e.g. Alu). Where the
 The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Emm., EMBL; Sw., SWISSPRCT; Tr., TREMBL; Wp., WGRMPEP; Information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence chromosome 20, constructed by the Sanger Centre Chromosome 20 Mapping Group. Further information can be found at Mattp://www.sanger.ac.uk/RgY/Chr20 RPPII-125P18 is from the library RPCI-11.1 constructed at the
 ALIS7412 45454 bp DNA linear PRI 31-JUL-2000 Human DNA sequence from clone RPI1-125P18 on chromosome 20 Contains STSs and GSSs, complete sequence.

LOCUS
 g
 This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality > 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest.
 Sequence Quality Assessment:
This entry has been annotated with sequence quality estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the Genbank flat file format but are available as part of this entry's ASN.1 file.

Submitted (29-MAY-2002) Department of Genetics, Washington
University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA
On Apr 24, 2002 this sequence version replaced gi:18030153.
 Submitted (03-DEC-2001) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. Louis,
 Mapping information for this clone was provided by Dr. John D. Merberson. Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wistl.edu/gsc
 Direct Submission
Submitted (24-APR-2002) Genome Sequencing Center, Washington
University School of Medicine, 4444 Forest Park Parkway, St. Louis,
MO 63108, USA
 NOTICE: This sequence may not represent the entire insert of this forms. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
 all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by

Unresolved tandem repeats exist between 44681 and 46316.
Polymorphisms exist between AC096659, AC0110771 and AC104070. Data
from AC110771 was used to finish AC104070.
 The sequence of AC068461 has been incorporated into AC104070

rpt\_family="ERV1"

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, B., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from and coworkers at http://www.resgen.com) or Pieter de Jong VECTOR: pBACe3.6

SOURCE INFORMATION:

The clone sequenced to the left is RP11-45120, 2000 bp overlap; the clone sequenced to the right is RP11-173M11. Actual start of this clone is at base position 108871 of RP11-45120; actual end is at base position 123291 of RP11-279K24.

NEIGHBORING SEQUENCE INFORMATION:

```

 49 GTGATTCGGCCTCCAGCTTCCCAAAGTGCTGGGATTACAGGCATGAGCCACCGCGCC 107
Assembly program: XGAP4; version 4.5
Chemistry: Dye-terminator; 100% of reads
Consensus quality: 147613 bases at least Q40
Consensus quality: 147851 bases at least Q20
Consensus quality: 148031 bases at least Q20
Insert size: 148899; 19.7% error; agarose-fp
Quality coverage: 24.62x in Q20 bases; sum-of-contigs Quality
coverage: 25.09x in Q20 bases; agarose-fp
 * NOTE: This is a 'working draft' sequence. It currently consists of 5 conigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the configs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 AC012440 159619 bp DNA linear HTG 01-MAR-2000 come sapiens clone RP11-11H11, WORKING DRAFT SEQUENCE, 21 unordered oldes:
 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.
1 (bases 1 to 159619)
 NOTE: This is a 'working draft' sequence. It currently consists of 21 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
 Insert size: 165000; agarose-fp
Insert size: 157619; sum-of-contigs
Quality coverage: 4.7 in Q20 bases; agarose-fp
Quality coverage: 4.9 in Q20 bases; sum-of-contigs
 contig of 1125 bp in length
gap of 100 bp
contig of 1693 bp in length

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 New polypeptide, that is a functional equivalent of ERCOA3 (Estrogen Receptor Coregulator 3), is useful in inhibiting or reducing tamoxifen or estrogen-induced proliferation of cancer cells and in treating
 The invention relates to a ERCOA3 (Estrogen Receptor Coregulator 3) protein and encoding polynucleotides. ERCOA3 can be used to inhibit or reduce teamoxifen or estrogen induced proliferation of cancer cells, by reduced activity of ERCOA3, and for detecting cancer cells that are ERCOA3 in cells. The encoding polynucleotide can be used to inhibit translation of a mRNA encoding ERCOA3 in ERCOA3 acts as a coregulator protein and can bind to the estrogen receptor to activate a molecular or cellular response in the cell. The present sequence represents the human

The invention relates to isolated polymucleotide (I) and polypeptide (II) cas useful as hybridisation probes, polymerase chain recombinant production of (II). The polymucleotides are also used and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polymucleotide sequences have applications in polymucleotide sequences have applications in diagnostics. Forgensiche for genetic disorders or other traits to assess bliddiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and among sequences. The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotides and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polynucleotides, polypeptides and preventive interventions. The polynucleotides, polypeptides and treat the cancers and proliferative disorders such as neoplasia, dysplasia and hyperplasia
 Library of polynucleotides for diagnosing a cancerous state of mammalian cell and detecting cancer, particularly of the colon prostate, comprises 3351 human polynucleotide sequences.

 The present sequence represents the BamHI-DNA insert of the recombinant clone pMptb #48 and encodes a 36K antigen of Mycobacterium paratuberculosis. The DNA sequence and its fragments are useful as hybridisation probes and amplification primers for detecting nucleic specific for the genus Mycobacterium, particularly for diagnosis of infection, especially by M. paratuberculosis which has been implicated in Crohn's disease and sarcoidosis. The 36K protein is useful in serological diagnosis and for vaccine development. (Updated on 17-OCT-2003 to

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (BST). The ESTS are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the ESTS arme genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be discovered. Co global expression of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTS provides several advantages over genomic or random CDNA clones including elimination of advantages over genomic or random CDNA clones including elimination of products to facilitate analysis of the results. This invention describes a novel nucleic acid (I) encoding an MLP (not defined) which has a 1273 base pair (bp) sequence (I) that includes a mutation at base 10 in exon 2 or the third position of codon 112 in exon 4, is new. The product of the invention has cardiant activity and can be used for gene therapy. (I), and related nucleic acids or probes, are used in diagnosis of and/or screening for mycardial diseases (or probes, are used predisposition), especially dilatative cardiomyopathy. Both specified mutations are associated with development of these diseases. Antibodies (Ab) raised against MCP and other peptides encoded by (I) can be used similarly. Also the regulatory region (III) of the genomic MLP sequence (optionally when incorporated into vectors or cells) is used in gene cherapy, specifically for prevention and/or treatment of cardiovascular disease, particularly those which involve a point mutation in a gene encoding sarcomer, dystrophin or cardial actin, e.g. hypertrophic cardiomyopathy. The regulatory region of the MLP gene provides muscle specific gene regulatory region of the MLP gene provides muscle specific gene regulatory region of the MLP gene provides muscle specific gene regulatory region of the MLP gene provides muscle specific gene can be used to be a provided muscle specific gene and the provides muscle specific gene can be used to be a point mutation in a gene can be used to be a point mutation of the MLP gene provides muscle specific gene can be used to be a point mutation of the MLP gene provides muscle specific gene can be used to be a point mutation of the MLP gene provides muscle specific gene can be used to be a point mutation of the MLP gene provides muscle specific gene can be used to be a point with the sequence regulatory region of the MLP gene provides muscle specific gene can be used to be a point with the sequence regulatory region of the MLP gene provides muscle specific gene can be used to be a point with the provides muscle specific gene can be used to be a point with the

The present invention describes an isolated phytase protein (I). (I) can be used for improving the nutritional value of a phytate-containing foodstuff, by contacting the phytate-containing foodstuff with (I), where the enzyme catalyses the liberation of inorganic phosphate from the phytate-containing foodstuff, and so improving the nutritive value of the opticate foodstuff. The liberation of inorganic phosphate occurs prior to or after the ingestion of phytate-containing foodstuff by a recipient organism. Nucleotide sequences (II) encoding (I) can be used for producing an animal feed, by transforming a plant, plant portion or plant cell with a nucleic acid expression vector, comprising (II), culturing the plant, plant portion or plant cell under conditions in which the plant cell into a composition suitable for animal feed. The animal is preferably a monogastric animal or a ruminant. (I) and (II) are useful in animal feed supplements as well as in treatments to degrade or remove excess phytate from the environment or a sample. (I) reduces the phytate levels in animal manure and so reduces the phosphate pollution of the present sequence encodes a phytase from the present

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid conding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibiting cellular polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity agene in an operon required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation or that that inhibits cellular proliferation of an orange of a compound's activity, (1) a culture comprising strains in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the test compound that inhibits of activity; (11) a culture comprising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium,

 This invention relates to pharmaceutical compositions for preventing or treating allergic diseases containing Mycobacterium-originated alpha antigens. The compositions are antiallergic, dermatological, antiacthmatic, antiinflammatory and optibalmological. The antigen and its encoded gene are for producing drug compositions in treating allergic conjunctivitis. The drug compositions are made from the protein that can inhibit production of interleukin-4, ameliorate Th2-type cytokine-predominate immune state and relieve symptoms of allergic diseases such as IgB production, histermaine release and eosinophilic infiltration. The present sequence represents the encoding sequence for a mycobacterium-originated alpha antigen. This encoding sequence does not encode the protein featured (ABB81662) despite being said to do so in the
 Medicinal use of Mycobacterium-originated alpha-antigen or its gene in treating allergic diseases e.g. atopic dermatitis, asthma, allergic rhinitis and allergic conjunctivitis.
